AAD05839 standard; cDNA; 974 BP 31-JUL-2001 (first entry) AAD05839; RESULT AAD05839

Transcription factor; trait modification; structural characteristic; developmental characteristic; gene therapy; agricultural biotechnology; Arabidopsis thaliana transcription factor G1073 cDNA.

Arabidopsis thallana.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                   The present sequence is Arabidopsis thaliana transcription factor G1073 cDNA. The transcription factors are used to modify traits associated which structural or developmental characteristics of plants, e.g.soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugar cane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, offee, cucumber, eggplant, grappsir, honey dew, lettuce, mango, melon, papaya, pass, watermelon, pineapple, spinach, squash, sweet corn, tobacco, tomato, peppers, onion, rosaceous firuits and/or vegetable brassicas when their expression levels are altered. The manipulation of transcription factor levels in plants offers great potential in agricultural biotechnology for modifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plant's traits. The transcription factors are also used in gene therapy.

                                                                                                                               ಥ
                                                                                                                                                                                      The present sequence encodes a plant transcription factor protein which modifies the flowering time of a plant. The polynucleotide sequence is used to produce transgenic plants which have a modified flowering time or a modified vernalisation requirement. The polynucleotides and polypeptides are useful for modifying plant development, physiology or biochemistry such that the modified plants have a trait advantage over wild type plants. In particular they are useful for accelerating, delaying or preventing flowering. The polynucleotides are also useful as nucleic acid probes and primers. They may be used to identify proteins that can modify the activity of

PROPED REPORT: 2001-135977/35.

PPSDB: AAE02571.

Nucleic acids encoding plant transcription factor polypeptides, useful for a learing the sugar sensing characteristics of plants and increasing relad, e.g. corn, potato and cotton plants -

Yield, e.g. corn, potato and cotton plants -

You patent relates to polynucleotides encoding 35 plant transcription

The invention relates to a novel cell cycle protein (CCP) and the CC plynucleotides encoding them. CCP is useful for identifying a compound which bindiates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for identifying the presence of CCP in a sample. A CCP modulator is useful for modulating the presence cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, conformation alfalfa, oilseed rape, soybean, sunflower and canola. CC cycle or growth of a plant such as rabidopsis thaliana, rice, wheat, cc CCP nucleic acid and polypeptide molecules are useful as modulating cell cycle progression in plants. CCP is useful as gapnts in regulating cell cycle progression in plants. CCP is useful at cc cc protein or production of CCP protein of production of CCP protein or production of CCP protein forms which have decreased or cc CC plant morphology, blochemistry as herbicides or plant growth regulators. The polymucleotide is useful for modifying cell fate, plant development, plant morphology, blochemistry and/or physiology, the length of the CC stimulation or enhancement of cell cycle of a plant, initiation, promortion, seed size, seed development, theory, fruit, leaf formation, seed size, seed development, module function, dwarfism in plants, seed size, seed development, module function, dwarfism in plants, cc and the anti-CCP antibody are useful in agriculture to modulate the coll cycle of cold, nutrient deprivation, har, drought, salt stress, or blots cc cold, nutrient deprivation, har, drought, salt stress, or blots creases and/or storage organs of plants or the plant architecture, plant quality traits, plant cold stress and attenuate plant architecture, plant quality traits, plant creased the stress and seed development, endoreduplication in storage organs or storage organs or storage organs or storage organs and the modulate cype organized cold, 
                                                                                                                                                                                                                                                     New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators
                                                                                                                                 De Veylder L, Acosta JAT, Magyar Z;

This invention describes a novel nucleic acid used for modifying the cell wall components of a plant. The modification is used for the improvement in digestion efficiency of useful crops and feed crops. The DNA is useful in agriculture, industry and gardening. This sequence encodes the Arabidopsis thallana ACWI protein which is described in the

The present sequence is Arabidopsis thallana transcription factor,

G605 cDNA. The transcription factor is used for altering a plant's

blochemical characteristics. The transcription factor may be used to

alter the structure and developmental characteristics of plants such as

soybean, wheat, corn, potato, cotton, rice, ollseed rape, sunflower,

alfalfa, sugar cane, turf, banana, blackberry, blueberry, strawberry,

raspberry, cartaloupe, carrot, cauliflower, coffee, cucumber, eggplant,

grapes, honey dew, lettuce, mango, melon, onlon, pappa, peas, peppers,

plineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon,

cosaceous fruits and/or vegetable brassicas. Transcription factors are

levels of 1 or more transcription factors can change entire biological

pathways in an organism. Therefore manipulating transcription factor

levels in plants offers great potential in agricultural biotechnology

con modifying a plant's traits. Transcription factor cDNA is useful in
                                                                                Transcription factor; blochemical characteristic; controlling element; structural characteristic; developmental characteristic; gene therapy; agricultural blotechnology; plant trait modification; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding plant transcription factor polypeptides, useful for altering the blochemical characteristics of plants e.g. corn,
